# “Sun city” in USA

40000 inhabitants, 40 km<sup>2</sup>  
unincorporated area

# Utopian city of Thomas More (1516)

English Humanist (finance, justice) / Henri 8th  
Utopia, inspired from Platon's Republic  
“in no man's land” or “happiness place  
Where tolerance and discipline are imposed

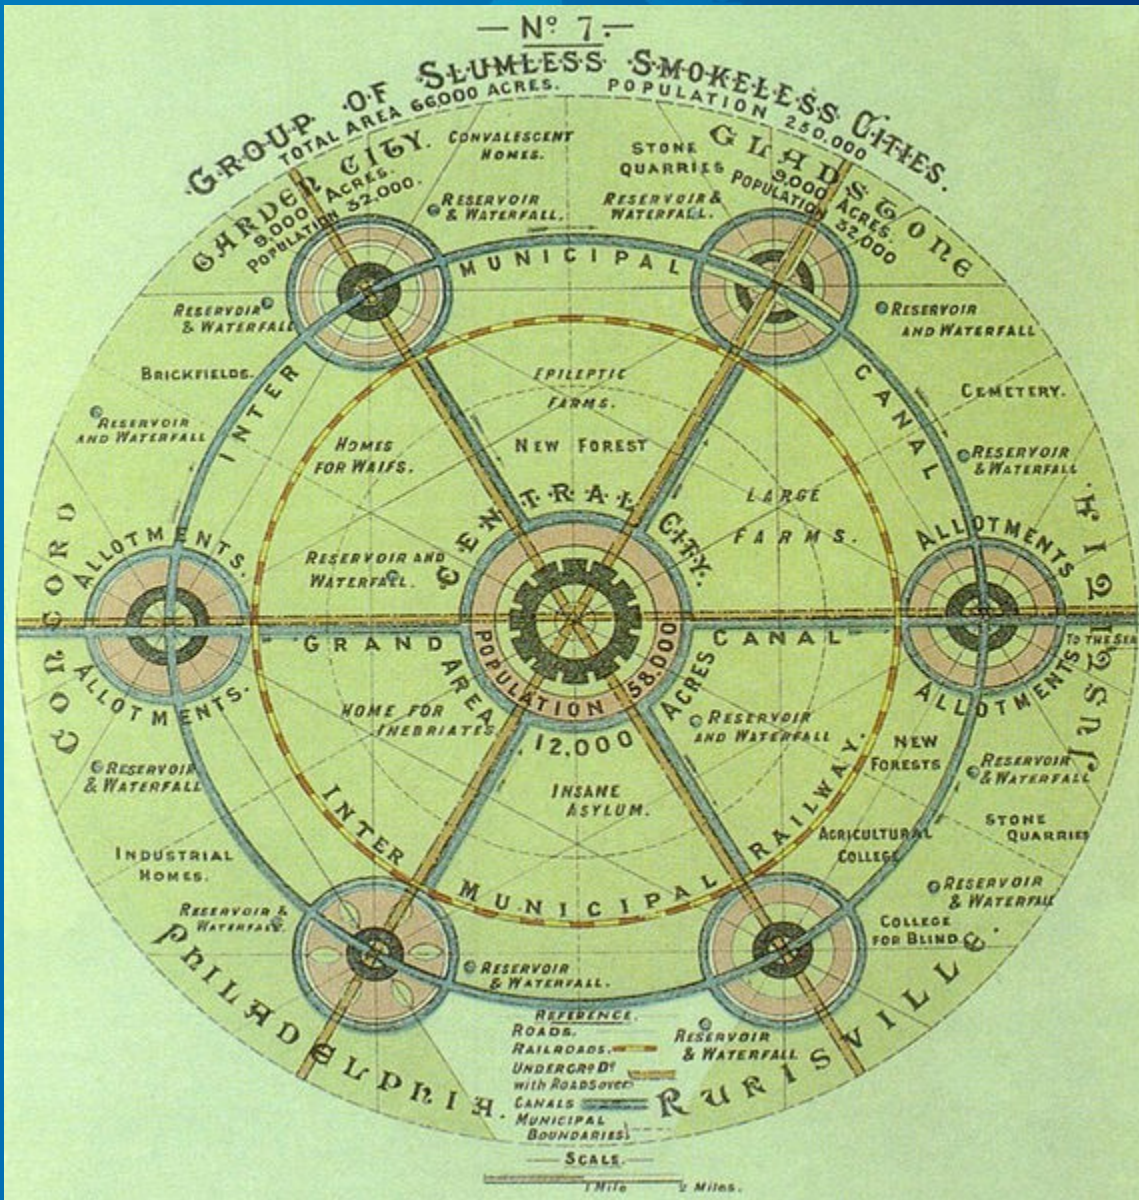

# The “sun city” of Tomaso Campanella (1623)

Italian monk - City with 7 fortified enclosures  
“equality” of the people, eugenics, collectivist society

# Shape of “garden cities”

Ebenzer Howard, 1898

British urbanist  
 Mixing economy/nature  
 Center: city council, theatre,  
 hospital ; periph: industry  
 6 sections separated  
 by large avenues  
 Ex: Letchworth (London),  
 Arcueil, Suresnes,  
 Genevilliers (Paris)

# Theory of central locations (Christaller, 1933, Lösch, 1940)

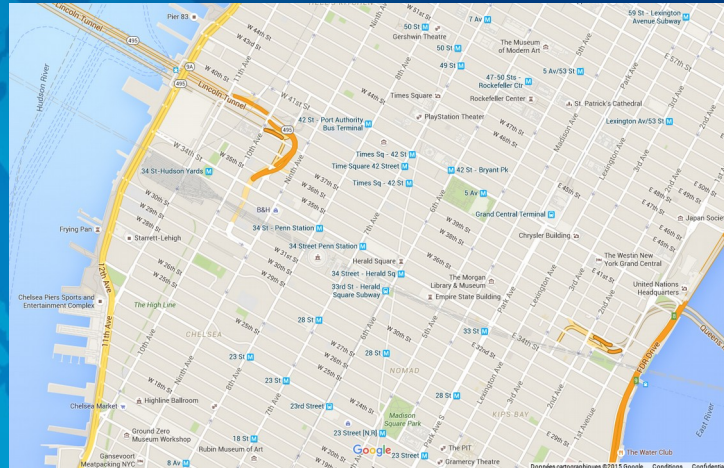

Principles ... from market .... to transport..... to administration

1. Market: richness concentration due to demand-supply economic relationship
2. Transport: cost minimization between hexagons
3. Administration: each center exerts a power on 6 contiguous secondary centers

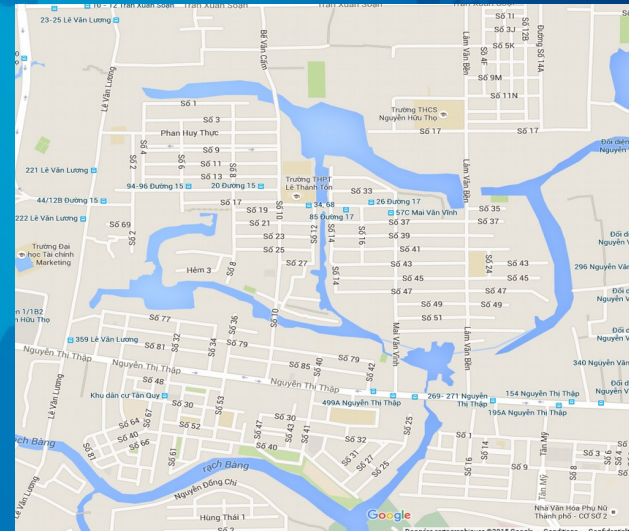

# Other rectilinear network shapes

Municipalité de Besançon, 1996

# Summing the agents passing on the network sections

(Freeman, 1977)

# Betweenness centrality

*Darker the line, higher the betweenness centrality (number of trips)*

# Optimality of the glu location

*Its does not “cost” a lot to the spider to lay the glu on the external turns!*

# CONCLUSION

- Graph theory is a useful approach to assess network efficiency
- Over 10-15 radii, straightness of radioconcentric networks and orbwebs is better than rectilinear networks...
- ...for centrifugal routes (spider) but also in general (for any route in average)
- The number of turns (circles/sides) has a lower importance than presumed

# ISSUES

- Can radioconcentric network fight efficiently against urban sprawl (*biomimicry*)?
- How much radioconcentric networks are traffic jam generators (*Multi-Agent simulations*)?
- What is the best network for straightness (*algorithm*)?
- Are orbwebs resilient (*Monte-Carlo simulations*)?
- Are orbwebs more efficient for other properties in graph theory from spider and human points of view (*graph theory*)?
- How to automatically extract graphs from photos (*imagery, mathematical morphology*)?
- Is the shortest path rational (other efficient routes) (*space syntax, Pareto multi-criteria analysis*)?

## Vol 4 - Asymmetry

### Special Asymmetry Issue of JIMIS

Introduction, Objectives, and Outlook in May 2018

*Introduction* – Studies on complex systems have emerged during the recent decades. The origin, evolution, and expression of asymmetry became an essential part of numerous complex systems. The journal *Nature* stated in 2012, that, in modern sciences, asymmetry-related phenomena belong to the five challenges as hard as finding the Higgs boson and just as potentially transformative.<sup>1</sup> Asymmetry-related phenomena are an integral part in new developments in arts, language, and social sciences. They become of increasing importance in economy and likewise in natural science such as mathematics, physics, and chemistry individually contribute along with biology to the advanced understanding of microscopic and macroscopic asymmetries. In the frame of the strongly interdisciplinary Asymmetry Project of UCA's Academy of Excellence "Complex Systems", we organized the First European Asymmetry Symposium (see <http://leas.fr>), 15–16 March 2018 in Nice, France. With more than 200 participants, 30 oral presentations, contributions of representatives at Cambridge University, Collège de France, and Max Planck Society, an orchestra with more than 50 musicians, and an artist exhibition from the National School of Fine Arts at the Villa Arson, the First European Asymmetry Symposium was highly successful. Scientific and public outreach of our Symposium were extraordinary as evidenced by illustrated reports published in *Nature*<sup>2</sup>, *Le Monde*<sup>3</sup> and in *Science & Vie*. Based on the success of the Symposium and its scientific and public outreach, we now edit a Special Issue on Asymmetry of the journal JIMIS. Please submit your manuscript until the deadline June 30<sup>th</sup>, 2018.

*Objectives* – Complex asymmetric systems such as the origin and evolution of asymmetric life, asymmetric amplification, asymmetric structures, asymmetry in economy and art – to name a few – are far from being understood and expressed. We expect that fundamental questions can be answered only through a trans-disciplinary approach that systematically complements the knowledge acquired in the traditional individual disciplines. The Special Issue on Asymmetry will summarize recent advances in the field.

*Outlook* – This edition of the Special Issue on Asymmetry is accompanied by the foundation of a new European Asymmetry (EA) Institute<sup>4</sup> based at UCA. The EA Institute will be a virtual institute without walls that organizes high-level asymmetry-related research and provides a trans-disciplinary infrastructure for academic exchanges via conferences, presentations, and summer schools.
